>> Expert knowledge at your fingertips

Our training courses aim to give you expert knowledge about your product's operation, so you can be working with it in a very short space of time.

We offer one or two day training courses for all our products either on-site or at our offices in the UK. The one day course concentrates on installing, configuring and operating your system and highlights how to achieve reliable and accurate results.

The two day course adds additional topics like fault-finding, data collection and analysis, plus techniques to help get the best out of your product. While the course is structured, there is plenty of time built-in to allow for discussion of principles and techniques that apply to your specific industry. The training also incorporates hands-on training as attendees often say this is the most useful way to put into practice what they have learnt.

We offer three day training courses for our RT-Range S products.

>> Advanced product training

If you want to train new members of staff or haven't worked with your OxTS products in a while, we can provide training courses tailored to your needs.

Whether you have to perform complex ADAS tests with your RT-Range S involving multiple vehicles or want to post-process data collected with our Survey+ or xNAV, our experienced technical support team is here to help. Contact us today to discuss your individual training needs.
